

# Krima Disperser - Type KD

KRIMA

Exer State

Recycling solutions for paper and organic waste.

Krima Disperser type KD a result of 60 years' experience and continuous development.

# Krima Disperser type KD

KRIMA Disperser is a further developed disc refiner suitable for high consistency treatment. The best results are reached when the inlet consistency is between 20 and 35 %.

#### Advantages:

- Optimum performance.
- ↔ Low energy consumption.
- Different dispersing discs.
- ₩ Long lifetime.

- 😡 Easy maintenance.
- Many reference plants.
- CO Discharge consistency 3 35 %.
- 😋 Capacity range 10 1100 tpd.

# The technically superior and patented infeed zone allows treatment of all types of fibers without risk of blocking.

The infeed zone also contributes to the very low energy consumption 35-45 kWh/ton of pulp. The power consumption varies according to the type of dispersing discs and operating temperature. The Disperser provides a high pumping effect

which feeds the pulp directly to the required station, i.e. machine vat or storage tower. In order to achieve maximum pumping effect, the rotor can be equipped with special pump flights.

An outlet consistency of up to 15 % can be reached in the standard disperser housing. A high consistency outlet can be, reached by using HC dispersing house configuration.

## Description

The KRIMA Disperser is mounted on a baseplate on which the main motor is also situated. This arrangement allows a perfect alignment between the disperser and the motor shaft.

All parts in contact with the pulp are manufactured in acid-proof steel. All other parts are sandblasted and coated with an epoxy-paint. The protective covers for the coupling and lubrication system are manufactured in polished stainless plate. The inspection openings are covered with plexiglass.

#### **Disc Gap Setting**

The disc gap can be adjusted either by mechanical-hydraulic or electro-hydraulic systems. Adjustment can take place during operation with either method and possibility of remote control is standard. The setting accuracy with both methods is 0.01 mm.

#### **Control Panel**

The Control Panel includes the electronic system DGC for disc gap control as well as the alarms and maintenance functions.

The Control Panel will be made according to customer's requirements and is manufactured of a water proof stainless steel cabinet with plexiglass covered door.

The bearing unit comprises a double thrust bearing and one radial bearing that are individually lubricated by means of oil Connection Outlet circulation. The lubrication system with temperature gauge for sealing and flow indicator are built into the baseplate. water The two hydraulic cylinders are used for the forward and reverse movement during adjustment of the disc gap. The rotating unit, which is moved by means of the hydraulic cylinders, consists of a main shaft with bearing unit and a rotor with dispersing discs. Inlet A toothed gear-type coupling forms the connection between the main shaft and the motor shaft. This allows the necessary movement for adjustment of the disc gap. Dilution Zone

# **Dispersing discs**

Cellwood Machinery AB has produced special dispersing discs that allow the fibres to be treated as gently as possible and at the same time completely disperse the contaminants. These discs also ensure a low energy consumption.

Discharge consistency 3 – 15%

### Service

KRIMA Disperser has a unique service function for easy and fast maintenance.

Disperser closed

Dispersing discs are available in different "deviltooth" patterns to give the best optimum result.Flexible discharge consistency from 3 - 35 %.

Discharge consistency 25 - 35%

Disperser open
